                                                                                                                                                                                                                                                                                                                                                              Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           A_Geneseq_0401:*

The peptide antagonists are based on a common motif of zor cc and human zonulins, which is believed to be critical for receptor CC and human zonulins, which is believed to be critical for receptor CC antinflammatory agents in the treatment of gastrointestinal confilmmation, where they bind to the zor receptor in the intestine CC antisflammation, where they bind to the zor receptor in the intestine CC intestine. Gastrointestinal inflammation conditions give rise to treatment intestinal conditions that cause protein losing enteropathy caused by infection, e.g. Clostridium difficile infection, c.g. clostridium difficile infection, anterocolitis, shigellosis, viral gastroenteritis, parasite mucosal erosion or ulcerations, e.g. gastritis, gastric cancer, CC collagenous colitis, inflammatory bowel disease, diseases with collisis colitis, inflammatory bowel disease, diseases with collisis colitis, inflammatory bowel disease, diseases marked by carection of congenital heart disease with Fontan's operation, c.g. securities, and after surgical correction of congenital heart disease with Fontan's operation, c.g. securities, and immune disease, c.g. e.g. systemic lupus erythematosus or food allergies, primarily to mucosal disease, essinophilic gastroenteritis, and immune disease, c.g. e.g. systemic lupus erythematosus or food allergies, primarily to

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    (TI). The peptide antagonists are based on a common motif of 207 and human zonulins, which is believed to be critical for receptor binding. They can be prepared by chemical synthesis or by use of recombinant DNA techniques. The peptide antagonists are used as an antiinflammatory agents in the treatment of gastrointestinal inflammation, where they bind to the 207 receptor in the intestine and yet does not physiologically modulate the opening of TJ in the intestine. Gastrointestinal inflammation conditions give rise to increased intestinal permeability and the peptide is useful for treating intestinal conditions that cause protein losing enteropathy caused by infection, e.g. Clostridium difficile infection, enterocolitis, shigellosis, viral gastroenteritis, parasite infestation, bacterial overgrowth, whisple's disease, diseases with
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             New peptide antagonist of zonulin useful as antiinflammatory agent for treating cerebral ischemia, stroke, cerebral edema, gastritis, shigellosis, viral gastroenteritis, meningitis, encephalomyelitis .
                                                                                                                                                                                                                                05-JUN-2000
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Sequence
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         This present sequence is that of a peptide antagonist of zonulin (2), one of 25 such peptides (see Y9105-29) of the invention, which bind to a zonula occludens toxin (20T) receptor, yet do not physiologically modulate the opening of mammalian tight junction.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Claim 1; Page 44; 69pp;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           WPI; 2000-205565/18

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                ind human zonulins, which is believed to be critical for receptor binding. They can be prepared by chemical synthesis or by use of crecombinant DNA techniques. The peptide antagonists are used as an antiinflammatory agents in the treatment of gastrointestinal inflammation, where they bind to the 207 receptor in the intestine cand yet does not physiologically modulate the opening of TV in the intestine. Gastrointestinal inflammation conditions give rise to increased intestinal permeability and the peptide is useful for treating intestinal conditions that cause protein losing enteropathy caused by infection, e.g. Clostridium difficile infection, e.g. clostridium difficile infection, bacterial overgrowth, whipple's disease, diseases with mucosal erosion or ulcerations, e.g. gastritis, parasite collagenous colitis, inflammatory bowel disease, diseases marked by imphatic obstruction, e.g. congenital intestinal lymphanglectasia, carcoidosis lymphoma, mesenteric tuberculosis, and after surgical corrections of concential heart disease with Fontan's operation,

                                                                                                                                                                                                                                                                                                                                                                                                                                        18-OCT-2000
                                                                                                                                                                                                                                                                                                                                                                                                                                                                               G36361;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         The synthetic gene encodes a protein corresponding to an antibody capable of binding to a specific antigen, in this case the HIV-1 tat protein. Many synthetic genes are synthesised, each containing a the heavy and light chains of antibody and undetermined nucleotide region encoding the framework regions of regions which are random sequences. The genes are then used in the construction of vectors which are subsequently used to transform microbes. The proteins thus produced are screened for binding activity to the specific antigen.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Sequence
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Antigen-binding proteins and corresp. synthetic genes - are constructed synthetically and used to make antibody library, disease diagnosis, etc.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Claim.13; Page 22; 40pp; English.

This present sequence is that of a peptide antagonist of zonulin (2), one of 25 such peptides (see Y79105-29) of the invention, which bind to a zonula occludens toxin (20T) receptor, yet do not (TJ). The peptide antagonists are based on a common motif of 20T binding. They can be prepared by chemical synthesis or by use of antinflammatory agents in the treatment of gastrointestinal inflammation, where they bind to the 20T receptor in the intestine and yet does not physiologically modulate the opening of TJ in the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Query Match

A79263 to A79736 and B25100 to B25570 represent polynucleotide and protein sequences isolated from eucalyptus (Eucalyptus grandis) or pir (Pinus radiata also known as Monterey pine). The protein sequences are involved in cell signalling. The polynucleotide and protein sequences can be used to modify the response of plant cells to external signals e.g. environmental changes or pathogens during the growth and developm of a plant. They can be used to modify cell proliferation,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    enterocolitis, shigellosis, viral gastroenteritis, parasite infestation, bacterial overgrowth, whipple's disease, diseases with mucosal erosion or ulcerations, e.g. gastritis, gastric cancer, collagenous colitis, inflammatory bowel disease, diseases marked by lymphatic obstruction, e.g. congenital intestinal lymphanglectasia, sarcoidosis lymphoma, mesenteric tuberculosis, and after surgical correction of congenital heart disease with Fontan's operation, mucosal disease, without ulceration, e.g. Menetrier's disease, coeliac disease, eosinophilic gastroenteritis, and immune diseases, eosinophilic gastroenteritis, and immune diseases, eng. systemic lupus erythematosus or food allergies, primarily to
                                                                                                                                                                                                                                                          Isolated polynucleotide encoding a polypeptide involved in cell signaling used for generating transgenic plants with modified r to external signals -
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      12-JAN-1999;

Examples of modifications which can be produced are altered fruit ripening and senescence of leaves and flowers e.g. to delay senescence and prolong the life of cut flowers or enhance senescence of reproductive organs to engineer sterile plants. Other modifications can be used to delay senescence in selected cell types or organs providing fruit and vegetables which have a longer shelf life between harvest and consumption, or to decrease branching frequency in forest tree species giving long stretches of valuable knot-free clear wood which can be used in solid timber furniture and veneers.
                                   sp. N-774 and Rhodococcus rhodochrous J-I.

Plasmid pYUKI21 contg. nitrile hydratase gene derived from Rhodococcus sp. N-774 is prepd. from a JM105/pYUKI21 culture. pYUKI21 DNA is digested with SphI and Sali. This fragment contains the nitrile hydratase gene which is radiolabelled for use as probe. The NH gene encodes an alpha subunit as represented here, and a beta subunit represented in R13898.
                                                                                                                          A DNA probe is prepd. from JM105/pYUK121 (FERM BP-1937) described in JP-A-2-119778/1990 due to the high degree of homology in the amino ac sequence between the nitrile hydratase beta subunit of Rhodococcus

The coding sequences were took by screening a genomic R. rhodochrous DNA library in EMBL3 amplified a 0.7 kb fragment of the amidase gene. The library screen isolated a phage containing a 15 kb insert. When analysed, the insert containing a napprox. 6 kb Sacl-EcoRI fragment (see T62387) nitrile hydratase alpha and beta subunits and another open reading frames for the amidase gene (762385), the encoding a 399 amino acid protein (W14162) of unknown function. The enzymes, prepared by genetic engineering methods, can be used in the industrial production of useful compounds.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  The specification describes the production of halogenated benzamides by enzymatic hydrolysis of halogenated benzonitriles using a Brevibacterium nitrile hydratase. This enzyme is a tetrameric enzyme comprising 2 alpha and 2 beta chains. The present sequence represents is derived (strain R312 or its mutant A4) have higher activity for hydrolysing halogenated benzonitriles than for hydrolysing benzonitrile. The method is especially for preparing 2,6-difluorobenzamide, which is an intermediate for insecticides, especially diflubenzuron.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Halogenated benzamide production - by halogenated benzonitrile hydrolysis with Brevibacterium nitrile hydratase enzyme

                                                                                                                                                                                                                                                                                                                                                                                                                                physiologically modulate the opening of mammalian tight junctions (TJ). The peptide antagonists are based on a common motif of ZOT and human zonulins, which is believed to be critical for receptor binding. They can be prepared by chemical synthesis or by use of crecombinant DNA techniques. The peptide antagonists are used as an antiinflammatory agents in the treatment of gastrointestinal inflammation, where they bind to the ZOT receptor in the intestine and yet does not physiologically modulate the opening of TJ in the cintestine. Gastrointestinal inflammation conditions give rise to increased intestinal conditions that cause protein losing enteropathy caused by infection, e.g. Clostridium difficile infection, creating intestinal overgrowth, whipple's disease, diseases with mucosal erosion or ulcerations, e.g. systemicis, gastric cancer, collagenous colitis, inflammatory bowel disease, diseases with mucosal erosion or ulcerations, e.g. systemial lymphangicetasia, correction of congenital heart disease with Fontan's operation, collagenous diseases without ulceration, e.g. Menertier's disease, collagenses without ulceration, e.g. Menertier's disease, collagenses, eosinophilic gastroenteritis, and immune diseases, collaise disease, eosinophilic gastroenteritis, and immune diseases, collaise.

partners to the proteins and the activity of the proteins can be identified. The pancreatic cancer antigens can be used to detect, treat or prevent pancreatic disorders, especially cancer. Agonists and antagonists to the antigens can be screened for. The pancreatic cancer antigen polynucleotides can be used to design nucleic acid hybridisation probes that can be used in chromosome mapping, linkage analysis, tissue identification and/or typing and a variety of forensic and diagnostic methods. The proteins can be used to generate antibodies which are used to purify, detect and target the polypeptides, including both in vivo and in vitro diagnostic and therapeutic methods. The proteins can be used to treat or prevent neural, immune system, muscular, reproductive, gastrointestinal, pulmonary, cardiovascular, renal or proliferative disorders. C99232 to C99240 and B54467 represent sequences used in the exemplification of the present intention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     called pancreatic cancer antigens, given in B54008 to B54466. The human pancreatic cancer antigens have cytostatic, neuroprotective, nootropic, immunomodulatory, relaxant, contraceptive, gynaecological, cardiant and antiinflammatory activities, and can be used in gene therapy. The polynucleotide and proteins can be used for preventing, treating, or ameliorating a medical condition or in assays for diagnosting a pathological condition or a susceptibility to one in a subject.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  "The complete genome sequence of the hyperthermophilic, sulphate-reducing archaeon Archaeoglobus fulgidus.";

Nature 390:364-370(1997).

-I FUNCTION: REMOVES THE 2'-PHOSPHATE FROM RNA VIA AN INTERMEDIATE IN WHICH THE PHOSPHATE IS ADP-RIBOSYLATED BY NAD FOLLOWED BY A PRESUMED TRANSESTERIFICATION TO RELEASE THE RNA AND GENERATE ADP-RIBOSYLASE (BY SIMILARITY).

RIBOSYLASE (BY SIMILARITY).

-I-SIMILARITY: BELONGS TO THE KPTA / TPT1 FAMILY.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Klenk H.-P., Clayton R.A., Tomb J.-F., White O., Nelson K.E., Ketchum K.A., Dodson R.J., Gwinn M., Hickey E.K., Peterson J.D., Richardson D.L., Kerlavage A.R., Graham D.E., Kyrpides N.C., Fleischmann R.D., Quackenbush J. ADDISON AND STEED BEING STEED 
                 RT glutathione-dependent formaldehyde dehydrogenase from Escherichia RT coll: a class III alcohol dehydrogenase from Escherichia RT coll: a class III alcohol dehydrogenase from Escherichia RT coll: a class III alcohol dehydrogenase.";

RL Blochemistry 3:475-481(1992).

CC -!- FUNCTION: HAS HIGH FORMALDEHYDE DEHYDROGENASE ACTIVITY IN THE CLASSENCE OF GLUTATHIONE AND CATALYZES THE OXIDATION OF NORWALL CLASSENCE OF GLUTATHIONE AND CATALYZES THE OXIDATION OF NORWALL CLASSENCE OF GLUTATHIONE THAN THOSE FORMED FROM GSH. INCLUDING CLASSENCE OF GLUTATY ACIOS, ALSO ARE SUBSTRATES.

CI -- CATALYTIC ACTIVITY: ALCOHOL + NAD(+) = ALDEHYDE OR KETONE + NADH.

CI -- CATALYTIC ACTIVITY: FORMALDEHYDE + GLUTATHIONE + NADH.

CI -- COFACTOR: REQUIRES ZINC FOR ITS ACTIVITY (4 IONS OF ZINC PER DIMER).

-- SUBUNIT: HOMODIMER.

-- SUBUNIT: BELONGS TO THE ZINC-CONTAINING ALCOHOL DEHYDROGENASE FRAMILY. CLASS-III SUBFAMILY.

-- CAUTION: REP: 1 AND REF: 4 SEQUENCE DIFFERS FROM THAT SHOWN DIFF TO a FRAMESHIFT IN POSITION 26
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                S
